Vodafone Ireland conducted an Assistant modernization of its virtual assistant TOBi

In order to maintain its position as a global leader in telecommunications, Vodafone is always exploring new opportunities to optimize its digital strategy and deliver exceptional customer service.

In collaboration with [IBM® Technology Expert Labs](#), Vodafone Ireland recently conducted an assistant modernization of its virtual assistant TOBi, which is powered by [IBM watsonx™ Assistant](#), a product that helps build better virtual agents to drive enterprise productivity. The firm had been pleased with the impact of the assistant so far, but, since it was running on an earlier version of the solution, there were many capabilities included in [the latest version](#) that the team had not yet taken advantage of. This meant the containment goals the team had set for the assistant were increasingly difficult to achieve and the resolution rate of the assistant was stuck at 35%.

Vodafone Ireland worked with Expert Labs to redeploy TOBi on the latest watsonx Assistant

Thus, Vodafone Ireland worked with Expert Labs to redeploy TOBi on the latest [watsonx Assistant](#), which contains generative AI capabilities. These new features leverage Large Language Models (LLMs) for retrieval-augmented generation (RAG), designed to generate accurate, conversational answers grounded in Vodafone's content. The solution also includes a natural language understanding (NLU) engine that uses a new foundation model based on transformer architecture to better understand human language and classify requests with a fraction of the training effort. It's also self-learning, which means it employs algorithms that automatically learn from past interactions how best to answer questions and improve conversation flow routing.

Migration led to compelling results

Once the migration was underway, the team conducted a comprehensive rebuild of all TOBi conversational journeys and executed necessary adjustments in their own application infrastructure. The migration led to compelling results:

– 3x improvement in the turnaround time for creating new conversational journeys
